Human Immunology

Aims and Scope

Human Immunology offers an exchange of information and ideas centering on the immunological system of humans. Pertinent information about the analogous systems of other vertebrates, including fish, birds, and mammals, may also be appropriate. The genes of the major histocompatibility complex and of T, B, and accessory cells and their products as regulatory molecules, disease markers, receptors, or targets are relevant topics. Subdisciplines such as neuroimmunology, immunopharmacology, and developmental and reproductive immunology are also considered insofar as they provide new insights. Limited space is available for reporting technological advances. Rapid publication of newsworthy items is provided by brief reports. Topics of general concern form the basis for editorials and seminar series.
